STATEMENT OF RESEARCH Much of my research relates to studies on the interaction between the lower atmosphere and vegetative surfaces with emphasis on methods to estimate fluxes between vegetation and the atmosphere. Extensive work on the development and refinement of the surface renewal method for estimating sensible and latent heat flux density with the main purpose to use it for estimating evapotranspiration. I have worked on evaluating the surface renewal method for direct measurement of latent heat flux and CO₂ exchange between a forest surface and the atmosphere. In the past few years, I have been closely involved in research to model plant phenological development and relate the models to possible climate change. Indeed, my most recent research effort is directed towards the development of risk assessment frameworks, focusing on impacts of climate change on crops, forest, and fires. My studies and research can be grouped into five main research lines:

- **Modelling of exchange processes between terrestrial ecosystems and the atmosphere**

Modelling of turbulent fluxes in agricultural, forestry, and urban systems with particular regard to the analysis and application of climatological, meteorological and micrometeorological models in order to estimate the evapotranspiration, energy balance and carbon fluxes at local and regional scales.

- **Analysis and management of risk connected to fire, drought and climate change**

Analysis of the relationships between weather conditions and wildland fires. Modelling of fire spread, behaviour, danger and emissions. Calibration and validation of different fire simulators and fire danger models in Mediterranean areas. Assessment of the impacts of climate and land use changes on fire regime, spread, behaviour, danger, at the Euro-Mediterranean level.

- **Ecophysiology of tree species**

Evaluation of eco-physiological parameters in tree species. Functionality of Mediterranean ecosystems. Stress responses and stress interactions in Mediterranean species

- **Phenology**

Development of models for predicting the onset of phenological phases. Relationship between environmental parameters and phenology.

- **Adaptation strategies for the agriculture and water resources**

Analysis of climate change impacts on agricultural sector and adaptation and mitigation strategies evaluation. Potential synergies and economic evaluation. Models and tools to evaluate the climate change impacts on agriculture. Focus on crop simulation models, land evaluation methodologies and downscaling techniques.

I am actively involved in European and international research activities on the assessment of impact of climate change and modelling in the field of agriculture and forestry.
